What You're Building: BulletProof

The brief

- Paste a resume and a job posting
- Click one button
- Copy tailored resume bullets
- Out of scope today: PDF parsing, cover letters, export

Track brief

Two Hours, Build in the Middle

Agenda

- 0:00 Check in and meet your neighbors
- 0:15 Claim credits, run setup, install and sign in
- 0:30 Build with Antigravity and the codelab
- 1:35 Two-minute demo, then submit

Jam page

Claim Your Credits Now

Setup

- Open the claim link and sign in with your personal Gmail
- Join the Google Developer Program, claim the badge
- Finish the verification on your phone
- Wait 2 to 5 minutes for the billing account to appear
- Claim today: credits can't be saved

If it fails

CRED-101: you're on a work or school account. Switch to your @gmail.com.

CRED-103: verification failed. Refresh, retry, or switch your phone to mobile data.

Run the Setup Script

Setup

- Open a new window with the same Gmail
- Scan the QR, or open github.com/harrisonahn1129/gdg_workshop_skills
- Click Open in Cloud Shell, type bash setup.sh
- All green: done. Any red: ask a TA

Setup repo

Install Antigravity

Setup

- Download from antigravity.google/download
- Run the installer with the default settings
- Git, and a GitHub account that can clone
- Don't click Sign in yet: next slide

Antigravity setup

Sign In With Your Credit

Setup

- Open Antigravity and click Sign in
- Choose Business account
- Continue with Google Cloud, same Gmail
- Choose Other: your project ID, location global
- Agent stops mid-build? You're on the free plan: sign out, repeat

Free plan

Sign in without Business account. Weekly limit, then the agent stops.

Your credit

Business account and your project ID. Build on this today.

The Codelab

Follow this codelab: your Google Cloud credits work here, not in AI Studio

Ten steps, about 75 minutes

Every step slide has its own QR code

Scan for the codelab

Setup | Plan | Review | Build | API | Verify

Install and Sign In to Antigravity

Step 1

- Done in setup: Antigravity installed and signed in with Business account
- Check: the welcome screen shows Open Folder and Clone Repository

Codelab step 1

Install uv and Git With the Agent

Step 2

- Open an empty folder, such as coding-jam-setup
- Prompt: “Install uv and git on my computer if they're not already there.”
- Approve each install command; skip Node.js
- If it fails, install uv and git by hand, then ask the agent to check

Codelab step 2

Clone the Starter Repo

Step 3

- Repo: gca-americas/codingjam-bulletproof
- Use Antigravity's Clone Repository button
- Read BRIEF.md and the reference/ folder
- Replace PASTE_YOUR_PROJECT and PASTE_YOUR_LOCATION, or .env gets placeholders

Codelab step 3

Install the Workshop Skills

Step 4

- Ask the agent to clone skills-garden and gemini-skills into .agent/skills/
- Click Allow on both git pop-ups
- Leave Turbo mode off

Codelab step 4

The Spec Talk Takes Two Minutes

Step 5

- The agent asks three questions: inputs, the magical moment, out of scope
- Answer them; no files get written yet
- If product.md appears, ask the agent to delete it

Codelab step 5

Three Design Docs Before Code

Step 6

- Gemini 3.8 - *Argon is limited**
- One prompt writes product.md, ui.md and engineering.md
- engineering.md needs a Testing strategy section
- Comment on the docs; fix the doc, not the code

Codelab step 6

Build It, Make the Tests Pass

Step 7

- Gemini 3.8 - Argon Limited
- The agent builds from the docs and mocks Gemini in tests
- Done: backend/, frontend/ and tests/ exist, all tests pass
- Never skip tests; fix the Testing strategy instead

Codelab step 7

Add Your Gemini API Key

Step 8

- Create a key in AI Studio; pick your jam project when it asks
- Sign in with your personal @gmail.com, not Workspace
- The agent writes backend/.env with GEMINI_API_KEY
- Check that .env is in .gitignore
- Treat the key like a password; never commit it

Codelab step 8

Run It and Check It by Hand

Step 9

- Ask the agent to start the dev server; click Allow
- Open localhost:8000 or localhost:5173
- Paste a real resume and a real job posting
- Report problems, then have the agent write the README

Codelab step 9

Tips for Better Bullets

Tips

- Paste the full job posting, not just the title
- Read the bullets aloud; if you wouldn't say it in an interview, change the prompt
- Skip cover letters, PDF parsing and ATS scoring on purpose
- Stuck? Ask the room, then a mentor

Track tips

Share and Submit Before You Leave

Step 10

- Two-minute screen-share demo
- Submit your build: it goes on the showcase
- Your name and chapter go with it

Submit your build

Keep Building at Home

After the jam

- Match score and missing keywords
- PDF resume parsing
- Cover letter generator
- Interview question generator
- Application tracker

Starter repo

Demo Builds to Fork

Demo repos

- codejam: the finished build from the starter repo
- codejam-claude: the same app, set up for Claude Code
- FastAPI and Gemini backend, plain JavaScript front end
- Both at github.com/xbill9, with design docs and tests
